Partitioning functions 3

Brief Overview

Paragon NTFS for 9x is designed to mount NTFS partitions under Windows operating systems as normal logical drives with appropriate drive letter.

- the full version mounts NTFS partitions for read and write operations.
- the demo version mounts NTFS partitions in read-only mode.

If you have the demo version of the program and want to buy a full version see our web page www.paragon-gmbh.com

Additional functions

- Creating, deleting, formatting, hiding, un-hiding primary, logical or extended partitions directly under Windows (Basic FDISK functions).

Hardware and System requirements

- Windows 95/98/ME
- 16 MB of RAM
- Either a NTFS partition or free space on hard disk to create it.

Installation under Windows 95/98/ME

The installation creates an own folder for the program, transfers all necessary files and installs the windows VXD driver named pntfs.vxd. The drive can be loaded only during Windows startup, hence you need to reboot Windows in order for driver to work.

Working under Windows 9x/ME

As Windows 9x/ME doesn't have possibility to change or assign drive letter dynamically, there is no 'Mount' command in interface. The driver assigns drive letters to all NTFS partitions at Windows startup, and then you can't change drive lettering in Windows. Windows interface of the program allow you basic FDISK functions like Create, Delete, Format partitions.

Partitioning functions

Paragon NTFS for 9x includes some basic partitioning functions for creating, deleting, formatting, hiding partitions etc. These functions were taken from another our program Partition Manager. They give you the ability to create new NTFS partitions, format them, mount them Under Windows 98/ME.

The following partitioning functions are available:

- Create partition (primary, extended and logical)
- Delete partition
- Format partition
- Hide / Unhide partition
- Set partition active / Set partition inactive (bootable / not bootable)

Following functions are not available *

- Resize partitions with data
- Resize cluster size of FAT partitions
- Copy/Clone partitions
- Move partitions
- Bootable DOS version

* These functions are part of the full version of Partition Manager product.

A more detailed description of the partitioning function is in the Help file for Paragon Partition Manager, which will be installed together with this Program in the same program folder.
